

Site Specific Controlled Remodelling

METHODOLOGY

ADAPT treated tissue firstly effects a repair and subsequently remodels into an extension of the host site with no loss of integral strength. Note: This remodelling is specific to the site of the implant i.e. adipose to adipose or as shown in this slide , muscle to muscle. This methodology is not to be confused with other reactions that are evidenced in other technologies such as tissue encapsulation and/or resorption, which is often referred to by other companies as “remodelling”

Trichrome - Stain
